1 Quotas

ZooKeeper has both namespace and bytes quotas. You can use the ZooKeeperMain class to setup quotas. ZooKeeper prints `WARN` messages if users exceed the quota assigned to them. The messages are printed in the log of the ZooKeeper.

```
$ bin/zkCli.sh -server host:port
```

The above command gives you a command line option of using quotas.

1.1 Setting Quotas

You can use `setquota` to set a quota on a ZooKeeper node. It has an option of setting quota with `-n` (for namespace) and `-b` (for bytes).

The ZooKeeper quota are stored in ZooKeeper itself in `/zookeeper/quota`. To disable other people from changing the quota's set the ACL for `/zookeeper/quota` such that only admins are able to read and write to it.

1.2 Listing Quotas

You can use `listquota` to list a quota on a ZooKeeper node.

1.3 Deleting Quotas

You can use `delquota` to delete quota on a ZooKeeper node.
